

**CLAIMS**

What is claimed is:

1. An active over passive coordinated motion winch device for use in a marine environment to position a payload and neutralize relative movement between said payload position and a destination position comprising:

a winch assembly including a drum, said drum having a hub defining an axis of rotation and a pair of flanges at opposing ends of said hub and perpendicular to said axis of rotation;

a control assembly constructed and arranged to selectively and operatively engage said winch assembly whereby variable torque and rotational speed or free rotation of said drum is provided;

a passive heave compensation assembly mechanically and fluidly connected with said control assembly, said passive heave compensation assembly including means for providing passive coordinated reciprocal movement between said payload position and said destination position;

an active heave compensation assembly mechanically connected to said winch assembly, said active heave compensation assembly including means for providing active coordinated reciprocal movement between said payload position and said destination position,;

whereby said passive heave compensation assembly and

1 said active heave compensation assembly cooperate with said  
2 winch assembly to reciprocally adjust the instantaneous  
3 payload position thereby neutralizing the relative movement  
4 between said payload position and said destination position.  
5

6 2. The coordinated motion winch in accordance with claim  
7 1 wherein said control assembly includes:

8 a main hydraulic power unit for supplying pressurized  
9 liquid to a primary hydraulic motor, said main hydraulic  
10 power unit fluidly coupled to said primary hydraulic motor  
11 via a primary supply tube, said primary hydraulic motor  
12 mechanically connected to said drum for providing selective  
13 power assisted rotational movement thereto.  
14

15 3. The coordinated motion winch in accordance with claim  
16 2 wherein said control assembly further includes a  
17 directional control valve, said directional control valve  
18 fluidly connected along said primary supply tube between said  
19 main hydraulic power unit and said primary hydraulic motor;  
20 whereby operation of said directional control valve in a  
21 first direction permits a pressurized liquid to flow from  
22 said hydraulic power unit to said primary hydraulic motor,  
23 via said primary supply tube, to rotate said primary  
24 hydraulic motor in a first direction and whereby operation of  
25 said directional control valve in a second direction permits  
26 a pressurized liquid to flow from said hydraulic power unit

1 to said primary hydraulic motor, via said primary supply  
2 tube, to rotate said primary hydraulic motor in a second  
3 direction.

4

5 4. The coordinated motion winch in accordance with claim  
6 3 wherein, said directional control valve is a infinitely  
7 variable positioning three way valve.

8

9 5. The coordinated motion winch in accordance with claim  
10 3 wherein, said directional control valve is a infinitely  
11 variable positioning four way valve.

12

13 6. The coordinated motion winch in accordance with claim  
14 3 wherein said means for providing passive coordinated  
15 reciprocal movement between said payload position and said  
16 destination position includes a gas spring accumulator, said  
17 gas spring accumulator having a variable volume gas portion  
18 and a variable volume oil portion, said gas portion and said  
19 oil portion being separated by a piston member, said gas  
20 portion fluidly coupled to an infinitely variable gas  
21 pressure source via a gas supply tube, said oil portion  
22 fluidly coupled to said primary supply tube between said  
23 primary hydraulic motor and said directional control valve;

24 wherein said gas spring acts to passively dampen  
25 response of said winch drum thereby reducing relative  
26 movement between said payload position and destination

1 position.

2

3       7. The coordinated motion winch in accordance with claim  
4 6 wherein said means for providing passive coordinated  
5 reciprocal movement between said payload position and said  
6 destination position includes a gas intensifier fluidly  
7 connected to said gas supply tube between said gas pressure  
8 source and said gas portion of said gas spring accumulator;  
9       whereby a gaseous fluid is supplied from said gas  
10 pressure source to said gas intensifier at a first pressure  
11 and said gaseous fluid is delivered from said gas intensifier  
12 to said gas portion of said gas spring accumulator at a  
13 second pressure.

14

15       8. The coordinated motion winch in accordance with claim  
16 7 wherein said second pressure is greater than said first  
17 pressure.

18

19       9. The coordinated motion winch in accordance with claim  
20 8 wherein said first pressure is at least about 500 pounds  
21 per square inch.

22

23       10. The coordinated motion winch in accordance with  
24 claim 8 wherein said second pressure is up to about 5,800  
25 pounds per square inch.

26

1           11. The coordinated motion winch in accordance with  
2 claim 6 wherein said gas pressure source includes at least  
3 one tank containing pressurized fluid.  
4

5           12. The coordinated motion winch in accordance with  
6 claim 1 wherein said means for providing active coordinated  
7 reciprocal movement between said payload position and said  
8 destination position includes a secondary hydraulic power  
9 unit for supplying pressurized liquid to a secondary  
10 hydraulic motor, said secondary hydraulic power unit fluidly  
11 coupled to said secondary hydraulic motor via a secondary  
12 supply tube, said secondary hydraulic motor mechanically  
13 connected to said drum for providing selective power assisted  
14 rotational movement thereto.  
15

16           13. The coordinated motion winch in accordance with  
17 claim 12 including a servo-valve fluidly connected along said  
18 secondary supply tube between said secondary hydraulic power  
19 unit and said secondary hydraulic motor, said servo-valve  
20 having a controller for generating a signal to said servo-  
21 valve in response to data received from at least one sensory  
22 input, wherein a pressurized fluid supplied by said secondary  
23 hydraulic unit is allowed to flow to said secondary hydraulic  
24 motor for rotation thereof in response to data received from

1 said at least one sensory input;  
2 whereby said servo-valve dynamically operates said  
3 secondary hydraulic motor in cooperation with said passive  
4 heave compensation assembly to neutralize relative movement  
5 between said payload position and said destination position.  
6

7 14. The coordinated motion winch in accordance with  
8 claim 13 including a booster accumulator connected along said  
9 secondary supply tube between said secondary power unit and  
10 said servo-valve, said booster accumulator having a variable  
11 volume gas portion and a variable volume oil portion, said  
12 gas portion and said oil portion being separated by a piston  
13 member;

14 wherein said booster accumulator maintains a supply of  
15 pressurized fluid during operation of said secondary power  
16 supply.  
17

18 15. The coordinated motion winch in accordance with  
19 claim 13 wherein said at least one sensory input receives  
20 data selected from the group consisting of drum acceleration,  
21 drum position, drum speed, gas spring piston position,  
22 payload acceleration, payload deceleration, gas intensifier  
23 pressure, stored fluid pressure, manual control valve  
24 position, pressurized fluid pressure or combinations thereof.
